- GetDNS
- SaveDNS
- RegisterDomain
- TransferDomain
- RenewDomain
- GetContactDetails
- SaveContactDetails
- GetEPPCode
- RegisterNameserver
- ModifyNameserver
- DeleteNameserver

Creating a Module

Creating a module is a very simple process. It's only as difficult as the API you will be connecting to. The below steps will guide you through the process.

1. Take the registrar module template and rename to modulename.php
2. Replace all occurrences of template_ with modulename_ inside the file
3. Add your code into the function calls
4. Delete any function calls that your module doesn't support
5. Save any changes
6. Upload to the path modules/registrars/modulename/modulename.php
7. Activate and configure your module in Config > Domain Registrars

That's it! You can now begin testing!
